vave length of the circult, depending pon the number of plates that are nserted in the condenser as it is valed from 180 degrees to zero.

By reason of this characteristic the variable condenser allows for very lose tuning.

A condenser consists of two electrical conductors separated by an insulator. The electrical conductors are called the plates and the insulating medium separating the plates is called:

In Fig. 1 is shown a simple condenser consisting of two plates, A and B, with air between two plates acting asthe dielectric. If now a battery C is One of the worst irritations suffered connected to the two condenser plates, by the crystal detector operator is the the positive side of the battery to one requent jarring out of good adjust-plate and the negative side to the othment. Often the slightest vibration er plate, a current will flow. This curcaused by a heavy footfall, slamming rent that flows from the battery termiof a door or someone brushing against hals when the battery is connected to justment has to be gone through again. less of charging a condenser an elec-C. Finally a point is reached where the back e. m. f. and the charging cur-

rent become zero. If the buttery C be disconnected from the condenser a potential difference will exist between the two condenser plates that will just be equal to the potential of the battery C. Short-circuiting the condenser plates will cause the condenser to discharge, a condition that will exist until the potential difference between the plates has been reduced to zero or until the dielectric has again resumed its nor-

Radio waves from Queenstowa. Ireland, were amplified in New York with such success that they disturbed the proceedings of the Supreme court in a building opposite the receiving sta-At present France has the

most powerful radio station in the world in the American built Lafayette towers near Bordeaux. The station now being erected at Port Jefferson, Long Island, will by the end of the year take firm Dr. H. W. Nichols, an eminent

electrical engineer, announces that the ether is not only not of. use in radio transmission, but that it is an interference. Dr. Nichols believes that much can be done to remedy the static disturbance by a means of sharper tuning.

Radio outfits have become so numerous in the apartment houses in New York that it has become a problem to find space for the antennae on the room. A scheme is being developed to have community service rendered to tenants over the house telephone wires.

Dr. Marconi is reported as saying that radio will result in the junking of the ocean cables. Mr. Mackay of the Commercial Cable system, says Marconf "talks through his hat." Ib seems to us that neither could be called a disinterested witness. It is only fair to Marconi, however, to say that it is doubtfulif he uses his hat as a means of transmission; the ether is toe
